

TOP IOTIPS:

Preventing Security Threats on your Network

- I Identify your weaknesses. Anything that allows access to the network, including employees, should be viewed as a weakness.
- 2 Install antivirus software on your computers.

 Many Internet service providers include these with your agreement to prevent malware attacks on your system.
- **3 Install perimeter security solutions.** Putting up a Firewall prevents unauthorized access to your network.
- **4 Filter spam email.** Choose a provider that offers consistent updates against new species of harmful junk mail.
- **5 Backup your important data.** Make a routine out of the practice to ensure private records remain safe.
- **6 Encrypt network data.** Consult a professional to make sure that important information is protected on your network.
- 7 Set up a virtual private newtork (VPN). This is a secure way to allow employees mobile access to your network.
- **8** Automate security updates. By enabling auto updates your computer will always have the most recent form of software and anti-virus programs installed.
- **9 Restrict and monitor.** Deny workers universal network access and study where they travel on the server.
- 10 Review your security methods. Ensure you stay aware of new security threats and improve your solutions to deal with them.
